How to find the wireless hardware address (or wifi address)

First, make sure the wireless card is "ON".

Choose an operating system below for details

...on an iPhone/iPod Touch/iPad
ResNet Wireless Registration

a. Click on the Settings button

b. Select General

c. Select About

d. Scroll down to see the listed “Wifi Address” -- this is what needs to be put into the registration

...on Windows XP
A. Go to Start, then Run

B. In the 'Run' window, type 'cmd' and press enter. This will open up the Command Prompt window.

C. In the Command Prompt window, type 'ipconfig -all'.

D. In the Command Prompt window, look for the network information for the Ethernet Wireless Network Connection. The 'Physical Address' will be the hardware address of the network card.
...on Windows 98

A. Go to Start, then Run. In the Run window, type 'winipcfg'.

B. In the IP Configuration window, at the top of the window, select the Wireless network adapter. The 'Adapter Address' will be the hardware address of the wireless card.

How to register my wireless card

A. Go to http://wireless-reg.unl.edu.

B. Have the student log in with their Blackboard information. (Note: If the user is a visitor, there is also a 'Visitor Registration' link on the page.)

C. On the next page, click on 'Register A Card'.

D. On the next page, enter the hardware address of the wireless card. You do not need to type colons or dashes, it is not case-sensitive.
E. After clicking 'Next', the registration will take 10-15 minutes, after which the user will need to select the 'tsunami' or 'UNL-AIR' network on their computer. You need to connect manually only once, but afterwards it will connect automatically since it is a preferred network.
